Problema

Se presenta un dataset que contiene información de alojamientos publicados en AirBnB con sus respectivos precios. El tamaño del dataset de train es de 1.5 Gb aproximadamente, y 0.5 Gb el de test. Este cuenta con 84 variables predictoras que se podrán utilizar como consideren adecuado.

El objetivo es asignar el precio correcto a los alojamientos listados.

Además del dataset se les provee esta notebook conteniendo el script de carga de datos y un modelo baseline que corresponde a una arquitectura feed forward.

▼ Consigna

A) Participación en Competencia Kaggle:

El objetivo de este punto es participar en la competencia de Kaggle y obtener como mínimo un Mean Absolute Error inferior a 70 puntos. [->Link a la competencia<-](#).

B) Utilización de Grid Search (o equivalente):

Para cumplir con la búsqueda de modelos óptimos se debe realizar un grid search lo más abarcativo y metódico posible. Recomendamos enfáticamente [Weights and Biases](#)

C) Se debe a su vez investigar e implementar las siguientes técnicas:

1. [Batch Normalization](#)
2. [Gradient Normalization y/o Gradient Clipping](#)

Además como en todas las tareas se evaluará la prolijidad de la entrega, el preprocesamiento de datos, visualizaciones y exploración de técnicas alternativas.

Realizamos un análisis más profundo de las columnas restantes

Para eso dividimos las columnas en subgrupos que agrupen variables con características similares, esto nos permite un mejor entendimiento de la base de datos, también nos facilita identificar si 2 columnas tienen información muy similar y están correlacionadas.

Las variables Accommodates, Bedrooms y Beds están altamente correlacionadas por lo cual se decide conservar únicamente una para evitar problemas de multicolinealidad en el modelo.

Se conserva la variable Accommodates ya que tiene mayor correlación con la variable objetivo (0.37 vs 0.29 y 0.36)

Existen otras correlaciones moderadas como por ejemplo Bathrooms con Beds, pero se mantienen dado que su nivel se entiende que no perjudicarán el modelo por su nivel moderado (~0.5).

▼ Imputación de valores nulos

Se utiliza el valor más frecuente en todos los casos para imputar los valores nulos considerando que corresponde un alto porcentaje del total de observaciones en todos los casos.

Accommodates es el unico caso donde el valor mas frecuente representa menos del 50% de las observaciones, pero dado que son solo 42 observaciones con valores nulos, se entiende que no ocasionará problemas en el modelo
